

# BI-02A.56 Equipment selected or designed to minimise static build-up and discharge

*(Accountable - Engineering Manager (Site) (Unassigned))*

## Expectations

Static discharge situations are identified and managed so that they do not ignite fires on mobile equipment.

**Review as an industry project if required**

## Specify

Site procedures, training and task planning ensures that personnel recognise static discharge situations during their work (e.g. replacing ropes on a drag line in high winds). Tools and materials that reduce the potential for residual electrical discharge are used when required.

Components or equipment with the potential for residual electrical discharge is located away from potential fuel sources and sensitive components.
