

BI-04D.05 Road design guidelines specify minimum requirements for delineation

Expectations

The design and installation of delineators assists mobile equipment operators to accurately estimate separation distances.

Specify

Road designs and construction requirements include standards for the accurate spacing of delineators along the road network.

Spacing guideposts are placed at distances relative to the distance required to be maintained between mobile vehicles. Red reflectors must be used on the left, white on the right.

Implement

Road construction crews place and maintain delineators at required distances
