

BI-04S.04 Access barrier performance - regular inspection and maintenance of barriers for access - boundary fencing and barriers

Expectations

Access to operational areas for personnel and mobile equipment is well managed. Barriers are in place that prevent unauthorised access including security (for site) and sentries/physical barriers (for blasting and other high consequence activities (including remotely operated mobile equipment) on site).

Specify

Operational areas and other locations are delineated, sign posted and fenced to prevent access by stock, uninvolved workers and or third parties. Access points are either locked or controlled e.g. with boom gates, security/sentries. There are regular inspections to confirm boundary, barrier and delineation performance integrity.

Implement

Security patrols confirm integrity of boundary and alert site personnel if entry is occurring / has occurred. Sentries provide warning to approaching vehicles and notify workers inside perimeter if an entry is required to occur.

Security patrols, sentries and other complete inspection forms to confirm site requirements are being met.

Barriers to high consequence areas are installed and maintained to meet requirements.
