

BI-05D.11 Emergency Preparedness

Expectations

The site has a formal approach for emergency preparedness.

Specify

There should be a formal approach to emergency preparedness on site. It should include multiple scenarios and consider local response, emergency response through to crisis management.

Scenarios include:

- Single vehicle crash
- Crash with multiple vehicles
- Vehicle roll over
- Equipment fire
- Emergency escape
- Entrapment
- Engulfment e.g. stockpile dozer falls into a void, vehicle in water
- Environmental incident - spills of material being carried and/or releases of fuels and lubricants

In determining preparedness, determine the appropriate number of trained personnel (internal and external) with the required response equipment and associated first aid/site medical facilities - that are available during work activities.

Implement

Emergency resources are developed and maintained based on planning.

Monitor

Reports on readiness and any drills conducted are prepared by site emergency response coordinators and are reviewed by senior site personnel.
